Lesson Plan Framework

Subject Area: Learning Support Math **Grade Level: 9**

Student Name: Grace Dittman

Domain I: Planning and Preparation	
PA Standard(s): • CC.2.2.7.EE.B.4 (foundational skill per IEP goals): Solve real-life and mathematical problems using numerical and algebraic equations, including one-step and two-step linear equations.	
Essential Question(s): Students will consider and reflect on throughout the lesson: • How do we solve one-step and two-step equations? • What steps help us eliminate fractions when solving equations?	
Objectives/Performance Expectations What will students know and be able to do as a result of this lesson? • Students will review solving one-step equations. • Students will learn to solve two-step equations. • Students will apply strategies to eliminate fractions when solving equations. • Students will work through 'tricky' equation examples that require extra attention. • Students will begin independent practice solving two-step equations.	
Assessment Evidence/Level of Learning Students will show what they know by evidence of/list names of formative or summative checks, quizzes, tests which indicate evidence of learning: • IXL progress-monitoring data • One-step equation review responses (4 questions) • Guided notes completion (one-step review section,	**Differentiated Instruction**: Modifications in instruction and assessment for students with learning differences, specifically those with 504's and IEP's. Extensions/Enrichment in instruction and assessment for students who are above grade level and/or gifted. • Visual schedule and timer displayed during

two-step equations, fraction elimination, tricky examples) • Participation during guided examples and tricky examples discussion • Progress on the two-step equations practice worksheet	IXL to support pacing and predictability • One-step review provided both on the board and on paper for multiple modalities • Notes include a built-in one-step review section before introducing two-step equations, to scaffold from familiar to new content • 'Tricky examples' placed last intentionally, once students are comfortable with standard two-step problems, so they don't get thrown off early • All new examples worked through together as a class before independent practice begins • Reduced problem set or extended time on the practice worksheet as needed (worksheet is not expected to be finished in class)

Domain II: Classroom Environment:

Describe Classroom/Behavior Management Plan & Routines

• Visual schedule and timer displayed during IXL

• Clear verbal and visual cues signal transitions, especially around the lunch break

• Consistent routine: IXL → one-step review → notes/new content → lunch → guided practice → independent practice

• Positive reinforcement for engaging with the harder 'tricky' examples

Domain III: Instruction

Activate Prior Knowledge/Motivation:

• (0-15 min) IXL for progress monitoring, with the visual schedule and a timer displayed on the board.
• (15-23 min) One-step equation review: 4 questions displayed on the board, with students completing them on paper.

Preparing students for the lesson: How will you activate prior knowledge, build background, or review previous lessons as well as motivate students for the lesson?

Materials Needed:

• Visual schedule (board/projector)
• Timer
• Devices for IXL
• One-step equation review sheet (4 questions)
• Two-step equation guided notes (including a one-step review section and a section on eliminating fractions)
• Two-step equations practice worksheet
• Pencils, calculators

Vocabulary (New or Review):

• One-step equation — review
• Two-step equation — an equation that requires two operations to solve for the variable
• Inverse operations — operations that undo each other (e.g., addition/subtraction, multiplication/division)
• Eliminate/clear fractions — a strategy to remove fractions from an equation before solving

Sequence of the Lesson:

• (23-35 min) Distribute two-step equation notes. Review the one-step equations section included in the notes.
• (35-45 min) Introduce how to 'get rid of' fractions when solving equations.
• --- LUNCH ---
• (45-65 min) Two-step equations: work through all examples together as a class.
• (65-75 min) Work through the 'tricky examples' section of the notes last, once students are comfortable with standard two-step problems.
• (75-90 min) Begin the two-step equations practice worksheet; students will not finish by the end of class.

What learning activities/strategies will you use to engage the students in the learning? What will students do to use and apply new concepts or skills (independent practice if relevant)? How will you monitor and guide their performance? Include relevant vocabulary. Use bullets to sequence your lesson.

Closure: What will you do to bring closure to the lesson? How will you summarize this lesson and preview the lesson that will follow?

• Collect notes and the partially completed practice worksheet (to be finished during a future class or as homework, per teacher preference).
• Briefly recap the steps for solving a two-step equation.

Reflection Guidelines

The student will write lesson plans with an eye to the Danielson Framework and the Four Domains of Professional Practice. Use this as a resource when writing

lesson plans.

Domain I Planning and Preparation

1. How do you know you were knowledgeable of your content?
2. What is the evidence that your objective was clear in the lesson plan?
3. How does the lesson address individual student learning needs?
4. What variety of strategies and methodologies did you consider when planning?
5. What is the evidence that lesson components were logically sequenced?
6. How did your lesson plan include checks for student understanding?
7. What PA Standards did this lesson address?

Domain II Classroom Environment

1. How did students know the behavioral and academic expectations for the lesson?
2. What effective routines and procedures did you implement for lesson efficiency?
3. How did you insure the classroom was physically accessible for all learners?
4. What evidence indicates that respect was shown between and among students and teacher?
5. What evidence indicates that students placed a high value on quality participation, process, and product?
6. How do you assess if the lesson was attainable for all students but also had appropriate rigor?

Domain III Instructional Delivery

1. How did you align your lesson to PA Standards?
2. How did you insure a clearly stated objective, understood by learners?
3. How did you provide clear explanations as to how to proceed through the lesson?
4. What questioning and discussion techniques insured all-learner participation?
5. What strategies did you employ to engage all students?
6. Describe how you made the content meaningful due to sequencing and pacing.
7. Discuss how you checked for understanding, provided feedback, retaught.
8. What is the evidence that you were you flexible and responsive to the needs of the learners?
9. Describe how you made meaning of the lesson with some form of closure activity.

Overall Assessment

Briefly state any changes you will make the next time you teach this lesson or activity, to improve any of the Domains of Professional Practice.
