Main Ideas/Questions	Notes/Examples

Parts of an Expression

$$7x + 3 - 5x + 8 + 4x - 1$$

Variable Terms
(Terms WITH a variable)

Constant Terms
(Terms WITHOUT a variable)

Coefficients
(Number NEXT TO a variable)

Combining Like Terms

You can simplify an algebraic expression by **combining like terms.** This means to combine common variable terms and constant terms.

Example: Simplify the expression below:

$7x + 3 - 5x + 8 + 4x - 1 =$ _____

Examples

Directions: Simplify each expression.

1. $3x + 6x$	**2.** $9a - 10a$
3. $7m - 5m - 6$	**4.** $9 - 6w + 5$
5. $7p - 1 - 9p + 5$	**6.** $5h - 6 - 8 + 7h$
7. $5x + 7y - x + 2y + 3x$	**8.** $26a + 2b - 4a + 10b$

with Exponents

Terms with the same exponents or combination of variables and exponents are considered like terms. When combined, be sure to NOT change their exponents!

Examples

9. $5x^2 + 7x^2$

10. $-15n^5 + 4n^5$

11. $8c^3 - 7c^3 + 16c^3$

12. $8k^2 - k - 5k + 7 - 2k^2$

13. $-4a^2b + 7 + 10a^2b$

14. $x^2 + 2xy - 7xy + 4y^2$

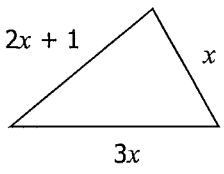

15. $a^2 + 7ab - 10ab + b^2$

16. $4x^2 - 7 + 2x - 3x^2 + 8x - 6$

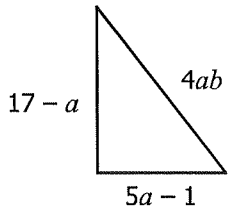

Geometric Applications

Directions: Give the perimeter of each figure as a simplified expression.
